

VERITRIS

Telecom + Energy Platform

15-Year Growth, Wholesale Power & Utility Partnership Strategy

AEP / Public Service Company of Oklahoma (PSO) and OG&E Decision-Maker Engagement Plan

\$12.5B	\$4.9B	\$25B	~\$69.2B
Year 15 Revenue	Year 15 EBITDA	Strategic Threshold	AEP Benchmark
Illustrative target case	39% blended margin	Illustrative Y12 valuation	Market cap as of Aug. 8, 2026

Prepared August 2026 | Strategic planning document - not a securities valuation, legal opinion, tariff filing, or assurance of regulatory approval.

1. Executive Decision Summary

Veritris should pursue a dual-track market entry. Track A builds a telecom-connected Energy OS that can be sold to utilities, resellers, large-load customers and energy-service companies. Track B establishes a legally separate power-marketing capability capable of wholesale participation in Southwest Power Pool (SPP) after obtaining the required FERC market-based-rate authority and SPP market-participant capabilities.

The central correction from a Texas/ERCOT analogy is that Oklahoma is not a broad retail-choice market. Veritris should not assume it can simply buy PSO or OG&E power and rebill ordinary residential customers. Instead, it should separate (1) wholesale transactions, (2) utility-approved or tariff-based retail services, and (3) value-added services that sit around the utility bill.

\$69.23B	\$9.77B	~915k	572k+
AEP	OGE Energy	OG&E	PSO
Current market cap benchmark	Current market cap benchmark	Customers in OK + western AR	Oklahoma customers

AEP already has both regulated utility operations and competitive wholesale/retail capabilities. Greg Hall, AEP's Executive Vice President and Chief Commercial Officer, is responsible for competitive retail, competitive wholesale, regulated commercial operations, renewable infrastructure development, and national customer/business development. That makes AEP's commercial organization a high-priority path for testing Veritris as a technology, origination, load-management, or channel partner.

Source: AEP Leadership; AEP Greg Hall profile (accessed Aug. 2026).

At PSO, President and COO Leigh Anne Strahler is the top Oklahoma operating sponsor; Bryan Walsh, Vice President of Generation Transformation, Strategy and Growth, is a particularly relevant functional target for generation strategy and growth discussions; Jeremy Ambrose, Director of Economic & Business Development, is a practical entry point for large-load and customer-development opportunities.

Source: PSO Leadership; PSO News, Apr. 20, 2026; PSO Economic Development.

At OG&E, Chairman, President and CEO Sean Trauschke is the executive sponsor. OG&E's 2026 Google agreements and proposed large-load tariff show that the company is actively structuring new commercial models for data centers and other large loads, making commercial strategy, economic development, regulatory, customer solutions and technology stakeholders logical targets.

Source: OG&E Leadership; OG&E Google announcement Apr. 30, 2026; OG&E large-load tariff announcement Jun. 18, 2026.

2. Veritris Business Architecture

Layer	Veritris Asset	Commercial Role
Connectivity	AirLink 5G, fiber, managed network, hosting/cloud, SecureWave	Acquire telemetry, enterprise accounts, sites and recurring connectivity revenue.
Control	Energy OS: billing, meter data, reseller CRM, API, AI forecasting,	Become system-of-engagement between customer, reseller and

	DER/EV controls	utility/market.
Energy	Veritris Power Marketing / retail partnerships	Procure, schedule, settle or resell where legally permitted; manage risk separately from software.

Commercial flywheel

- Telecom account -> connected meter/device -> Energy OS subscription.
- Energy OS account -> demand-response, DER, EV and bill-optimization revenue.
- Commercial/large-load account -> utility partnership, procurement analytics and wholesale origination opportunity.
- Aggregated load/data -> better forecasting, pricing, customer retention and acquisition economics.
- Wholesale capability -> bilateral structures, PPAs and market settlement without forcing the software company to own generation.

3. Wholesale vs. Retail: The Actual Pathways

Pathway A - Independent wholesale power marketer in SPP

FERC authorizes wholesale sales of electric energy, capacity and ancillary services at market-based rates for qualified sellers. An applicant seeking market-based-rate authority files under Section 205 of the Federal Power Act and submits a proposed tariff through FERC's eTariff process.

Source: FERC, Electric Market-Based Rates; Initial Applications.

SPP's Integrated Marketplace includes day-ahead and real-time energy, operating reserves and bilateral settlement functionality. SPP distinguishes asset-owning market participants from financial-only participants; asset-owning participation requires additional operational capabilities such as meter data and ICCP connectivity.

Source: SPP, Join SPP RTO; SPP Markets & Operations.

- Create a separate Veritris Power Marketing entity.
- Retain FERC/SPP regulatory counsel and market-registration advisor.
- Prepare FERC MBR application and tariff.
- Select SPP participation model: financial-only, asset-owning, or use a qualified scheduling/market agent first.
- Establish credit/collateral, risk limits, ETRM/settlement controls and 24x7 operating procedures as required by the chosen role.
- Negotiate bilateral supply/offtake contracts independently of retail utility service.

Pathway B - Sell to PSO/AEP or OG&E as a wholesale counterparty

A utility can be a buyer, seller, transmission customer, RFP counterparty or bilateral counterparty. AEP publicly maintains operating-company RFP channels and AEP Energy Partners has solicited renewable PPAs. Veritris should monitor formal RFPs while separately pursuing commercial-development meetings. A utility relationship is commercially valuable, but it is not the legal prerequisite for all SPP wholesale activity.

Source: AEP B2B/RFP site; AEP Energy Partners renewable PPA RFP, Jul. 30, 2025.

- Sell power/RECs/capacity through a bilateral agreement when Veritris has a qualified supply position.
- Originate third-party generation or storage and earn development/origination economics.
- Provide load shaping, demand response or DER aggregation services where tariff and market rules permit.
- Offer software to improve customer enrollment, load forecasting, DER visibility or large-load coordination.

Pathway C - Retail or resold service in Oklahoma

Treat retail resale as a regulated/tariff-dependent strategy. The preferred near-term structure is to leave utility electric service with PSO/OG&E and charge Veritris separately for Energy OS, connectivity, optimization, DER management, EV management, managed power-quality services and commercial analytics.

Pathway D - Texas retail expansion

Texas remains the better market for a direct retail-brand strategy. Veritris can partner with or ultimately become a certificated Retail Electric Provider, while the local transmission and distribution utility continues physical delivery. This Texas operating experience can become proof of retail-energy competence without incorrectly assuming Oklahoma has the same structure.

4. AEP / PSO Decision-Maker Identification Strategy

Do not start with a generic corporate sales pitch. Build a stakeholder map around the exact commercial pathway being tested.

Priority	Current target / function	Why they matter	Question to test
1	Greg Hall - EVP & Chief Commercial Officer, AEP	Owns competitive wholesale/retail, regulated commercial ops, renewables and national business development.	Can AEP evaluate Veritris as wholesale origination, reseller/channel, large-load or energy-tech partner?
1	Leigh Anne Strahler - President & COO, PSO	Top Oklahoma operating sponsor across customer, regulatory, financial and distribution functions.	Which PSO pathway can accept a non-utility software/energy platform without conflicting with certified retail service?
1	Bryan Walsh - VP, Generation Transformation, Strategy & Growth, PSO	Generation transformation and growth are directly relevant to supply, DER and large-load strategy.	Where can Veritris add generation, storage, demand or software capability?
2	Jeremy Ambrose - Director, Economic & Business Development, PSO	Practical entry point for new business loads, site development and economic-development packages.	Can Veritris bring or manage commercial/data-center loads and provide their digital energy layer?

2	Johannes Eckert - EVP & Chief Information & Technology Officer, AEP	Relevant to SaaS, integrations, cybersecurity, digital platform and technology procurement.	What vendor/architecture path is required to pilot Energy OS or grid-edge integrations?
3	AEP Supply Chain / RFP organization	Formal procurement and RFP channel.	Which RFP/vendor onboarding process applies to software, energy services and power supply?

How to identify the next layer below executives

- Search current AEP/PSO organization pages, recent rate cases, RFP documents, conference panels and job postings for titles containing Commercial Operations, Energy Marketing, Origination, Load Growth, Large Load, Customer Solutions, Regulatory, IT/OT, Grid Modernization, Demand Response, DER and Economic Development.
- For every public executive, identify 2-3 directors/VPs who operationally own the subject. The goal is a 6-10 person account map, not a single executive contact.
- Use PSO Economic Development first for large-load/customer-development angles; use AEP commercial leadership first for wholesale/origination angles; use IT leadership only after the business sponsor confirms a use case.
- Monitor AEP/PSO RFP pages monthly and register Veritris in supplier/procurement systems before asking for a pilot.

Known public entry point: Jeremy Ambrose, Director of Economic & Business Development, PSO - 918-855-7468 - jdambrose@aep.com.

Source: PSO Economic Development page, accessed Aug. 2026.

5. OG&E Decision-Maker Identification Strategy

Priority	Target / function	Why they matter	Question to test
1	Sean Trauschke - Chairman, President & CEO	Executive sponsor for strategic partnerships and large-load growth.	Would OG&E sponsor a commercial evaluation of Veritris for large-load, energy-software or channel services?
1	Economic Development team / Christy Idleman public contact	OG&E states this team supports power availability, rate forecasts, expansion capacity and site decisions.	Can Veritris jointly originate/manage new commercial and data-center loads?
1	Large-load / commercial strategy owner	OG&E is actively implementing large-load customer protections and Google data-center agreements.	Can Energy OS manage customer telemetry, forecasting, flexibility, DER and cost-allocation workflows?
2	Regulatory / Rates leadership	Any reseller, tariff, demand-response or large-load structure must fit OCC-approved rules.	Which existing or proposed tariffs allow third-party services, aggregation or customer-facing bundles?
2	Technology / customer	Required for platform	What security, API, vendor

OG&E's April 2026 Google announcement and June/July 2026 large-load policy activity are important signals: the best initial value proposition is not 'let us replace OG&E.' It is 'let Veritris help you acquire, connect, forecast, manage and monetize new large loads while protecting existing customers.'

Source: OG&E Google data-center announcement, Apr. 30, 2026; large-load tariff announcement, Jun. 18, 2026; HB 2992 statement, Jul. 23, 2026.

6. 120-Day Utility Engagement Campaign

Window	Objective	Actions	Deliverable	Success test
Days 0-20	Credential Veritris	Form Power Marketing subsidiary; utility counsel; supplier registrations; one-page architecture; cybersecurity overview.	Utility-ready capability packet.	AEP/OG&E contacts view Veritris as credible vendor/partner, not an unlicensed retail supplier.
Days 20-45	Discovery	Request meetings with PSO economic development, PSO strategy/growth, AEP commercial, OG&E economic development and OG&E large-load/rates.	Five discovery briefs.	Identify at least two permissible commercial structures.
Days 45-70	Design pilot	Choose one software/large-load use case and one wholesale/market use case.	Pilot SOW + regulatory pathway memo.	Named internal sponsor and technical owner.
Days 70-100	Commercial proof	Build sandbox/API demo; model customer economics; develop SPP/FERC onboarding workplan.	Demo + economic case.	Utility agrees to procurement, pilot, RFP, NDA or structured follow-up.
Days 100-120	Institutionalize	Finalize partnership route or proceed independently with SPP/FERC pathway.	Board/investor go-no-go package.	Defined capital requirement, timeline and counterparties.

Discovery questions to ask AEP/PSO and OG&E

- Do you currently purchase bilateral energy, capacity, RECs, storage services, load flexibility or demand response from non-affiliate counterparties? Through which team and contracting vehicle?
- Would you consider a third-party Energy OS that sits outside the regulated bill but integrates customer usage, telecom connectivity, DER, EV charging, alerts and large-load forecasting?
- For large-load customers, which functions can a third party provide: customer acquisition, site telemetry, demand forecasting, DER orchestration, private fiber/5G, energy management, billing analytics or settlement support?
- Which data-access standards and customer-consent mechanisms are available for interval meter data?
- Are there existing tariffs or pilots that permit demand response, aggregation, managed charging or third-party DER participation?
- If Veritris secures FERC market-based-rate authority, what commercial requirements would apply for bilateral transactions with your commercial/power-supply organization?

- Which supplier registration, cybersecurity, insurance, credit and contracting requirements should we satisfy before a pilot?

7. Value-Added Services Veritris Can Sell Without Replacing the Utility

Offer	Utility/customer value	Revenue model
Energy OS / white-label portal	Improved customer visibility, alerts, interval analytics and digital engagement.	Per meter/month SaaS + integration.
Large-load telemetry & forecasting	Better forecasts and operational visibility for data centers/manufacturing.	Enterprise SaaS + implementation.
Private fiber/5G + energy telemetry	Single provider for resilient connectivity and grid-edge data.	Connectivity MRR + managed service.
Demand flexibility orchestration	Automates curtailment, batteries, HVAC, EV fleets and flexible loads.	SaaS + performance share.
DER / storage control	Improves customer asset dispatch and potential market participation.	Per asset/month + transaction fee.
Commercial bill optimization	Demand-charge, tariff and usage analytics without reselling power.	Subscription + savings share.
Reseller/ESCO control panel	Lets approved partners brand and manage value-added energy services.	Platform fee + account fee.
Wholesale origination / scheduling	Adds supply, PPA, REC or bilateral capabilities once authorized.	Trading/origination margin.

8. 15-Year Financial and Valuation Model

The model remains deliberately capital-light through the software/telecom phase and introduces larger energy facilities only after Veritris has contracted customers, positive EBITDA and institutional controls. Values are scenario targets rather than a valuation opinion.

Yr	Revenue	EBITDA	Implied value	Primary engine	Capital milestone
1	\$3M	\$-2M	\$0.01B	Telecom build	\$3M Seed
2	\$9M	\$-1M	\$0.04B	Telecom + cloud	-
3	\$24M	\$2M	\$0.12B	Energy OS	\$12M A
4	\$60M	\$10M	\$0.30B	White-label SaaS	-
5	\$140M	\$28M	\$0.70B	TX entry	\$35M B
6	\$300M	\$70M	\$1.50B	Resold energy	-
7	\$575M	\$150M	\$3.00B	Multi-state	\$100M C
8	\$950M	\$260M	\$5.00B	Wholesale entry	-
9	\$1,500M	\$430M	\$8.00B	Wholesale scale	\$250M Growth
10	\$2,300M	\$700M	\$12.00B	National platform	-
11	\$3,400M	\$1,100M	\$18.00B	DER/large load	\$600M facility
12	\$4,800M	\$1,600M	\$25.00B	\$25B threshold	-
13	\$6,500M	\$2,300M	\$34.00B	Institutional scale	\$1.5B project
14	\$9,000M	\$3,400M	\$49.00B	Pre-AEP	-
15	\$12,500M	\$4,900M	\$69.23B	AEP-scale	\$2.8B public/strategic

Illustrative cumulative outside capital: approximately \$5.3B across 15 years, with project/structured capital becoming dominant after wholesale and large-load revenue is proven.

9. Acquisition Attractiveness and Strategic Gates

Gate	Illustrative value	What must be true	Likely buyer universe
Platform proof	\$0.3B	Recurring telecom/energy SaaS, utility integrations, low churn.	Telecom, grid software, utility-services platforms.
Energy-tech scale	\$3-5B	Positive EBITDA, multi-state customers, REP/wholesale partnerships, managed load.	Utilities, energy retailers, infrastructure funds, strategic tech.
National strategic scale	\$25B	\$4-5B revenue, \$1B+ EBITDA, wholesale capability, institutional controls.	Major utilities, infrastructure funds, public markets, hyperscale ecosystem.
AEP-scale benchmark	~\$69.2B	\$12B+ revenue, multi-billion EBITDA, durable contracted/regulated cash flows or equivalent high-quality recurring economics.	Public-market standalone; mega-cap utility/energy combinations.

What increases a strategic buyer's willingness to pay

- Own the customer/reseller software layer while keeping commodity and regulated risk in separate subsidiaries.

- Demonstrate low customer-acquisition cost by cross-selling to existing telecom accounts.
- Secure multi-year contracts with large-load customers, utilities, ESCOs or resellers.
- Build proprietary interval-load, device and pricing data with explicit customer permissions.
- Use standardized APIs and utility-grade cybersecurity so the platform can integrate rather than replace core systems.
- Prove a repeatable SPP/ERCOT market-operations capability and strong credit/risk governance.
- Avoid excessive balance-sheet ownership of generation until asset ownership clearly improves margins or strategic control.

10. Recommended Go / No-Go Sequence

- GO now: Energy OS MVP, telecom integration, commercial analytics, large-load telemetry, PSO/OG&E discovery meetings, supplier registration, and FERC/SPP feasibility counsel.
- GO after counsel: separate Veritris Power Marketing entity, FERC MBR application, SPP market-agent or participant path, bilateral origination.
- GO selectively: Texas REP partnership/certification as a retail proof market.
- DO NOT assume: ordinary Oklahoma PSO/OG&E retail customers can be freely switched to Veritris or that utility power can be rebilled without an applicable tariff/authorization.
- DO NOT make wholesale capability dependent on an AEP/OG&E partnership. Treat those utilities as valuable counterparties and strategic customers while preserving an independent SPP/FERC route.

- Public Service Company of Oklahoma, Leadership; Economic Development; 2026 announcements on Bryan Walsh and large-load/ratepayer protection.
- OG&E, Leadership; Economic Development Market Insights; 2026 Google data-center agreement; 2026 proposed large-load tariff and HB 2992 statements.
- Market-cap benchmarks: AEP approximately \$69.23B and OGE Energy approximately \$9.77B as of Aug. 8, 2026 market data.

Appendix B - Meeting Request Positioning

Suggested positioning: 'Veritris is building a telecom-connected Energy OS for commercial and large-load customers. We are evaluating two distinct tracks: (1) value-added software/connectivity/demand services that complement regulated utility service, and (2) a separate FERC/SPP wholesale power-marketing capability. We would like to understand which commercial, tariff, procurement and data-access pathways PSO/AEP or OG&E would consider for a pilot or bilateral relationship.'
